

MegaFerm

More forage in the rumen

MegaFerm

Welcome to TheTransitionCompany

We are an international nutrition consultancy for the dairy industry. Based on your farm's unique situation, our specialists advise you on how to make the cow's transition period run as smoothly as possible. The starting points are healthy livestock and optimum yields. We look at not just one aspect of your farm, but the whole farm and all your business processes. And we do this with the express purpose of giving you, the dairy farmer, an insight into where improvements can be made.

Because every farm is unique, we use a tailor-made approach that involves analysing various business processes. Our close ties with veterinarians and nutritionists give us insights into areas such as rationing, forage cultivation plans and the focus on forage harvesting.

When analysing your business processes, we look together at the options for achieving returns on your farm. For us it is paramount that you as the farmer should remain in control. We believe it is important to share ideas with you about how you as a dairy farmer can look forward to a carefree future with your business.

With our technical expertise and practical experience, we have been helping dairy farmers to produce healthy livestock and optimum yields

for more than 15 years. This is not a short-term solution but a long-term one.

Efficient digestion

High-quality yeasts

MegaFerm consists of a high-quality yeast culture that supports the rumen microbes. The addition of the yeasts to the ration neutralises the rumen and ensures a more stable pH value in the rumen. The yeasts in MegaFerm feed the rumen bacteria which take care of the digestion of the feed.

Because this digestive process is more efficient, it is possible to get more forage into the cow's rumen. Feeding MegaFerm will ultimately result in more kilos of milk produced from one kilo of feed.

How is MegaFerm supplied?

MegaFerm is supplied in 25-kilogram bags. It can easily be added to the ration via the feed mixer or directly added to the feed.

Thoroughly tested

MegaFerm has been extensively trialled in practice to measure the effect of the dosage on milk production, fat (g/%) and protein (g/%). During these trials, a TMR ration consisting of 70% grass and 30%

maize was used.

An exponential growth of micro organisms in the rumen was observed. Feeding MegaFerm demonstrably produced more fat and protein per cow per day.

What are the benefits?

Healthy rumen

A healthy rumen means a healthy cow.

Improved fibre digestion

MegaFerm improves the digestion of crude fibre. This improves feed intake and feed efficiency.

Contact

Would you like to more learn more? Feel free to contact us without any obligation. We are happy to discuss our the numerous options for tailor-made advice together with you. TheTransitionCompany team prioritises personal relationships and we are committed to maintaining lasting relationships with our customers.
